4/39

э

Order and Disorder

Two competing energy scales:

- Thermal fluctuation: $\sim k_B T$
- 2 Interaction between spins J_{ij}

 $J_{ij} \gg k_B T$: Ordered magnet (Ferromagnet or Anti-ferromagnet)

 $J_{ij} \ll k_B T$: Disorderred magnet (Paramagnet)

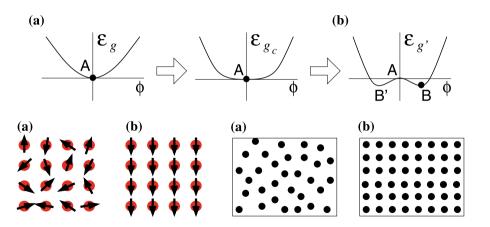

Phase transition at T_c

Geometrical Frustration

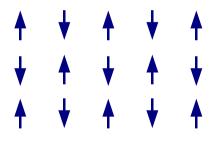

antiferromagnet e.g. $H = \sum S_i S_j$

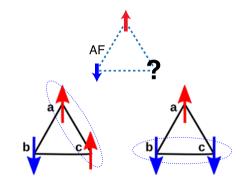

Feng	

Geometrical Frustration

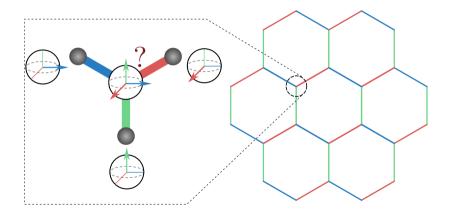

antiferromagnet e.g. $H = \sum S_i S_j$

Geometrically frustrated magnet

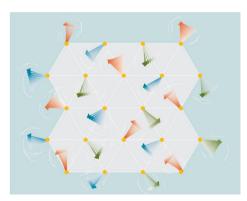

Exchange Frustration

Frustration

Consequences of Frustrations

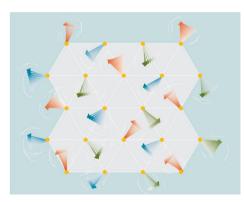

- $\textcircled{0} \text{ No order at } \mathcal{T} \to 0$
- O symmetry breaking
- **③** No s = 1 magnons or spin waves

Shi Feng (OSU)

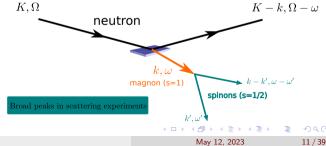

< ロ > < 同 > < 回 > < 回 >

Consequences of Frustrations

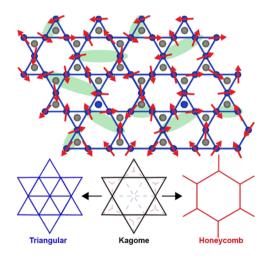

- **1** No order at $T \rightarrow 0$
- O symmetry breaking
- **(3)** No s = 1 magnons or spin waves
- Strong quantum fluctuation \rightarrow *quantum spin liquid*
- Solution Elementry excitations are Spinons $(s = \frac{1}{2})$

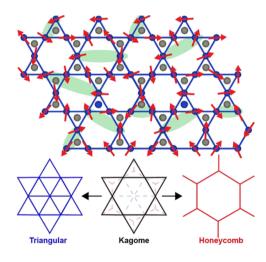

Frustrated Systems (Criteria)

Frustrated Systems (Criteria)

Shi Feng (OSU)

- Localized electrons (Mott Insulator)
- 2 Small spins, preferably spin- $\frac{1}{2}$
- **③** Geometrical or exchange frustration
- Spin-orbit coupling

Frustration Parameter

Two temperature scales:

- T_N at which magnetic order develops
- Curie–Weiss temperature Θ_{CW}

$$\chi \sim \frac{C}{T - \Theta_{CW}}$$

Spin solid (ordered) Θ_{CW} T_N $|\Theta_{CW}|$ T

The frustration parameter:

 $f \rightarrow \infty: \mbox{ True QSL} \label{eq:gsl} f > 100 \mbox{ is a good indication of possible QSL}.$

$$f = \Theta_{CW} / T_N.$$

... and how to cut

- More degrees of freedom to manipulate (cut 1 into 4)
- It must preserve the number of distinguishable states (as a faithful representation)
- It must preserve the SU(2) algebra of spins $[\sigma^{\alpha}, \sigma^{\beta}] = 2i\epsilon_{\alpha\beta\gamma}\sigma^{\gamma}$

Majorana: no anti-particle

Majorana's anti-particle is itself

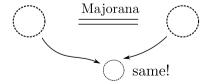

creation operator γ^{\dagger}

Spin-Majorana Transformation

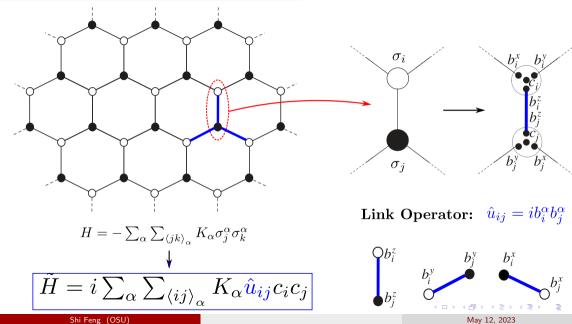

Link Operator: $\hat{u}_{ij} = i b_i^{\alpha} b_j^{\alpha}$

Shi Feng (OSU)

Spin-Majorana Transformation

Shi Feng (OSU)

23 / 39

Recap

• We have mapped a single spin-1/2 particle into 2 fermionic modes, then to 4 Majorana modes:

- It is a faithful representation because
 - (i) These Majoranas give the correct Hilbert space
 - (ii) These Majoranas reproduce spin-1/2's SU(2) algebra.
- The spin Hamiltonian into Majorana Hamiltonian by Links:

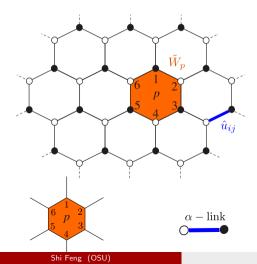

$$H = i \sum_{\alpha} \sum_{\langle ij \rangle} K_{\alpha} \hat{u}_{ij} c_i c_j$$

Conserved Quantities

Link Operators (vector potential) and Plaquette operators (flux)

$$\begin{split} [\hat{u}_{ij},H] &= 0\\ [\tilde{W}_{p},H] &= 0\\ \downarrow\\ \\ \text{Extensive } \# \text{ of conserved quantites}\\ \{W_{p}\} \text{ and } \{u_{ii}\} \end{split}$$

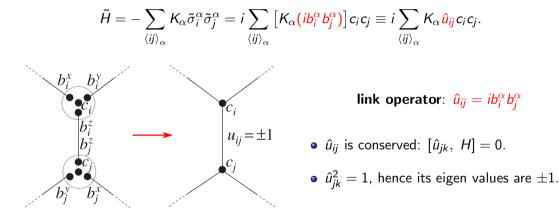

May 12, 2023

25 / 39

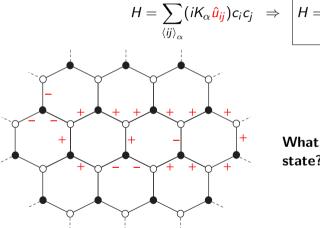

э

Link is Conserved: $u_{ij} = \pm 1$

The Hamiltonian using Majorana fermions:

With u_{ii} being static numbers, the Hamiltonian becomes quadratic of c_i Majoranas:

$$\Rightarrow \quad H = \sum_{\langle ij \rangle_{\alpha}} (iK_{\alpha} u_{ij}) c_i c_j$$

What to assign to $\{u_{ij}\}$ for low energy state?

Diagonalize the Ground State Hamiltonian

Recall that we wanted to diagonalize H represented by sectors of $\{u_{jk}\}$ in $\tilde{\mathcal{L}}$:

$$H = \sum_{\alpha} \sum_{\langle jk \rangle_{\alpha}} (iK_{\alpha}u_{jk})c_ic_j.$$

Now the redundant dofs can be projected out by simply fixing a $\{w_p\}$ sector.

Theorem

Lieb (1994): Ground state has no vortices $\iff \{w_p = +1\}.$

Therefore we can choose the simplist configuration $\{u_{jk} = +1\}$:

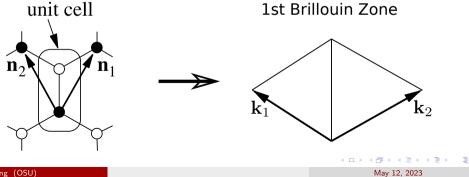

$$\{u_{jk} = +1\} \Rightarrow H = \sum_{\alpha} \sum_{\langle jk \rangle_{\alpha}} iK_{\alpha}c_jc_k$$

28 / 39

$$H = \sum_{lpha} \sum_{\langle jk
angle_{lpha}} i K_{lpha} c_j c_k \quad \Rightarrow \quad \mathsf{Quadratic Hamiltonian of itinerant Majoranas}$$

Go to momentum space by Fourier transformation:

$$c_{j} = rac{1}{\sqrt{N/2}} \sum_{\vec{k}} e^{i \vec{k} \cdot \vec{r_{j}}} a_{\vec{k}}, \quad c_{k} = rac{1}{\sqrt{N/2}} \sum_{\vec{k}} e^{i \vec{k} \cdot \vec{r_{k}}} b_{\vec{k}}.$$

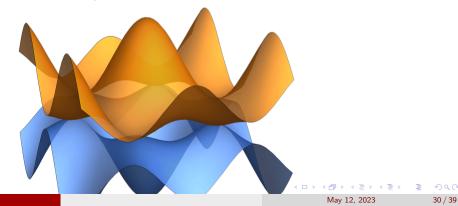

Single particle spectrum

Shi Feng (OSU)

Majorana Bands:

$$\epsilon(ec{k}) = \pm rac{1}{2} \left| f(ec{k}) \right|$$

For $K_{\alpha} = C$ it's identical to TB Graphene:

ARPES & $S(k, \omega)$
